REVIEW AND APPROVAL STATEMENT

USAFETAC/TN-91/001, *Glossary of AWS Acronyms--Acronyms, Initialisms, and Abbreviations Commonly Used in Air Weather Service, January 1991*, has been reviewed and is approved for public release. There is no objection to unlimited distribution of this document to the public at large, or by the Defense Technical Information Center (DTIC) to the National Technical Information Service (NTIS).

REPORT DOCUMENTATION PAGE

2. Report Date: January 1991
3. Report Type: Technical Note
4. Title: Glossary of AWS Acrinabs--Acronyms, Initialisms, and Abbreviations Commonly Used in Air Weather Service
6. Author: George M. Horn
7. Performing Organization: USAF Environmental Technical Applications Center (USAFETAC/LDE), Scott AFB, IL 62225-5438.
8. Performing Organization Report Number: USAFETAC/TN-91/001
12. Distribution/Availability Statement: Approved for public release; distribution is unlimited.
13. Abstract: A collection of acrinabs (acronyms, initialisms, and abbreviations) commonly used in the Air Force Air Weather Service. The acrinabs in this listing have been collected from a number of technical publications, journals, directives, and other glossaries. The collection is intended for use as a *decoding* device and should not be considered an authoritative source to spelling, exact meaning, or usage.
14. Subject Terms: DICTIONARIES, ABBREVIATIONS, AIR WEATHER SERVICE, acrinabs.
15. Number of Pages: 58
17. Security Classification of Report: Unclassified
18. Security Classification of this Page: Unclassified
19. Security Classification of Abstract: Unclassified
20. Limitation of Abstract: UL

GLOSSARY OF AWS ACRINABS*

***Acronyms, Initialisms, and Abbreviations Commonly Used in Air Weather Service**

PREFACE

This guidebook to the many and various "acrinabs" used in the Air Weather Service (AWS) was first published, very informally, as "A USAFETAC Guide to Alphabet Soup." When the demand for copies suggested much wider distribution, it was reissued in August 1989--again as an informal, unnumbered pamphlet. Since then, AWS and the other government agencies with whom AWS does business have continued to create "acrinabs" almost as fast as it was possible to collect them and include them in a new version--this time published as a technical note so as to share the collection with the rest of the scientific/technical community.

The acrinabs in this listing have been picked from actual documentation. Most are from technical reports and technical journals. Others are from DoD, USAF, and AWS directives. Some were collected from other glossaries. The editor cannot guarantee that these listings represent "official" usage in all cases, but care has been taken to enter each item as it was presented in the source. Note that the glossary is intended for use as a "decoding" aid-- it should not be used as an authoritative source for use in official documents.

Although some expressions that are more operational than technical may be included here, they are few. Contractions (ACFT, CLR, CIG, etc.) have been avoided for several reasons. For one, their meanings are relatively easy to infer. For another, they proliferate much more slowly. Finally, they are covered very well elsewhere.

This list is still far from comprehensive. Readers are urged to continue sending additions and corrections to the attention of the USAFETAC Technical Publications Editor, USAFETAC/LDE, Scott AFB, IL 62225-5458, DSN 576-6648.

The editor wishes to thank the following ladies, each of whom made a significant contribution to publication of this collection: TSgt Penny Clavell, Mrs Shirley Claxton, Sgt Shaun Porta, and Sgt Corinne Gage.

GLOSSARY OF AWS ACRINABs

INTRODUCTION

I predict that on December 3, 1989 government and industry will grind to a halt. On that date we will have used every permutation of the 26-letter alphabet for every possible acronym for every possible purpose. At that point Congress will legislate the addition of several new letters so that government and industry can continue.

--Frank Romano
Editor/Publisher, Typeworld

For some very good reasons (as well as for some very bad ones), the practice of combining bits and pieces of compound terms to form shorter ones has been common practice for more than 50 years. But thanks to exponential proliferation, today's readers have every reason to feel as if they have been cast adrift on a vast sea of alphabet soup, and Mr Romano's forecast may only have erred in the timing. To illustrate, the first edition of the Gale Research Company's *Dictionary of Acronyms, Initialisms, and Abbreviations* was published in 1960 and contained some 12,000 entries. In the ninth edition for 1985-86, the Gale list had grown to 300,000, plus what was later added to two supplements. The explosive growth of what Gale Research calls "abbreviomania" may soon put them (and us) in the unfortunate position of seeing acronyms, initialisms, and abbreviations created faster than they can be collected and published.

The idea of shortening word compounds (especially in technical writing) is a good one if practiced in moderation. The shortened forms of which we speak save time and money and can, in fact, increase the possibility for comprehension. Imagine a world, for example, in which we were forced to say or write "light amplification by stimulated emission of radiation" for *laser*, or "radio detection and ranging" for *radar*. There is no rule, however, that requires us to create such short forms every time we note that certain words seem to go well together.

In view of what has become a national (indeed, an international) trend, there is little one can do except hope that future "abbreviomaniacs" have the grace to exercise restraint and observe at least the following simple rules.

Stifle the usage to shorten a word compound solely because you've used it twice in the same paragraph. And don't even think about shortening a term you'll only use once.

Avoid "back formation," or the practice of creating the acronym first, then supplying the words required to make it come out right. Some suspicious examples are "TREE" (transient radiation effects in electronics), "DISCUS" (Distributed Source Conducting Medium Underground-System Simulator), "BLAST" (Building Loads Analysis and System Thermodynamics), and "GRASP" (Generalized Retrieval and Storage Program).

Before coining a new short form, take the trouble to check on how many have been there before you. There are at this writing at least 49 different meanings for "DCA." Don't assume that "just one more wouldn't hurt."

When you *do* coin a new short form, you should at least assume responsibility for it. Explain what it means (at first use) in every document. Never assume that your creation (unlike laser and radar) needs no explanation. In longer documents, consider attaching an alphabetical list of all acronyms, initialisms, and abbreviations used.

Understand the mechanics of your creation. There are subtle shades of meaning used in describing the three basic types of compound-shortening under discussion here:

An **acronym** is composed of the initial letters (or parts) of a compound term and is usually read or spoken as a single word. Examples are RADAR, LASER, and LANTIRN. Note that many such coinings, after falling into common usage, gradually lose their capitalization and become legitimate words; examples are *radar* and *laser*.

An **initialism** is composed of the initial letters of a compound term, but is verbalized letter by letter, rather than as a single word. Examples are AWS, ADPE, AFCRL, and ARQ.

An **abbreviation** (or contraction) is the shortened form of a word or words that do not follow the formation of either of the above. Although shortened, they are usually verbalized as the original word. Examples: APRT, FCST, INTL, BKN.

In the spirit of Alice in Wonderland ("When I use a word, it means just what I choose it to mean--neither more or less"), the computer community has chosen to refer to all the foregoing as *mnemonics*. It's probably too late to point out that such usage stretches the literal meaning of the word past breaking, but mnemonics are *memory aids* such as those we've all made up in school to help us remember long strings of elements, mathematical expressions, and so forth. An example of a real mnemonic is "HOMES," one way of remembering that the Great Lakes are named Huron, Ontario, Michigan, Erie, and Superior.
